# COMPLETE AGENT ARCHITECTURE

## CURRENT OBSERVATION

Public prices, market stock, open shops and visible rival farm; own cash, inventory and worker state

## COMPATIBLE PRODUCTION CHOICES

Start from a replay-derived work schedule
Synchronize selected wheat-to-carrot cycles
Choose sheep or cows before buying new animals
Update purchases, yields, bags and delivery times

## FORECAST-GUIDED SELLER

16 observed features estimate rival sales
Four forecast intervals cover the next 24 turns
Compare sale quantities and settlement scenarios
Apply cash, stock-age and endgame rules

## FARM EXECUTION AND LOCAL REPAIR

Follow the selected worker schedule
Clear weeds and reschedule disrupted tasks
Compute required purchases and hiring times
Reserve inputs, working capital and order slots

stock, cash needs, capacity

required orders

## ORDER SCHEDULER

Protect necessary farm orders within the 10-slot cap
Accept sales only within the available capacity
Place admitted sales early when funding is needed
Replan using observed inventory and actual fills

worker actions

market orders

## OFFICIAL GAME ENGINE

Execute worker actions, then settle shared-market orders
Return the resulting farm state, inventory, prices and cash

NEXT-TURN FEEDBACK

Production choices → executable work → coordinated trading → observed outcomes
